Not illustrated. 1861 Excerpt: .surveying: Such a line every director of mines ought to have marked out in the situation of the mine he directs. (50a.) If the student be acquainted with the application of spherical trigonometry to astronomy, he will find the following method of finding the true meridian to be greatly preferable to that just given. Let S represent the place of the sun s centre, P the north pole, and Z the zenith; these three points being the angles of a spherical triangle SPZ (the student can readily draw the figure for himself), in which SZ represents the co-altitude of the sun, when he comes into the direction of the required bearing of the drift in the mine; SP the sun s co-declination on the day of observation (which will be found in the Nautical Almanack for the year in which the observation is made); and PZ the co-latitude of the place of the mine (which is usually well known). From the given spherical triangle SPZ the angle Z may be readily found, which is the azimuth or bearing of the sun from the north at the time of observation, and also the bearing of the drift; whence also the true meridian may be readily deduced for the following purpose. To determine the magnetic variation of the needle of any instrument. (51.) Suppose N and S to be marks representing the true meridian, S the south and N the north; place the instrument (whose magnetic variation you...
